

Team Ozymandias - Relational Schema

The state entity and attributes are taken directly from the SOAP relational schema. We created the person, politician, expert, state/local, federal, and committee to be added to the database. Person replaces congressperson and is subdivided into politician and expert. Politician is even further subdivided into state/local and federal for better organization. Every type of person can belong to a committee, so that relation is applied to person. Every politician represents a state, so that is applied to politician. Person takes on all relations that Politician is involved with, as reflected on the relational schema.

* from original schema
