

# Team Ozymandias - Relational Schema

## LOCATION\*

<u>zip_code</u> *	<u>street</u> *	<u>house_number</u> *	city*	state*	mun_id
-------------------	-----------------	-----------------------	-------	--------	--------

## MUNICIPALITY

<u>mun_id</u>	name	zip_code
---------------	------	----------

## RULES

<u>mun_id</u>	zoning_rules	building_rules
---------------	--------------	----------------

The relational schema was created from the team ER diagram. Location has an added attribute of municipality id (foreign key from municipality) in order to satisfy the IS\_IN relationship. Rules is a weak entity dependent on municipality, so its primary key is municipality id. This schema will allow us to relate rules to each municipality and integrate our design into the current database.
