

Team Ozymandias - ER Diagram

The location entity and attributes are taken directly from the SOAP relational schema. We created the municipality, zone, and rules relations to be added to the database. The municipality relation has a municipality id for the primary key. This is because we did not believe zip code and name were candidate keys. Each municipality will have a corresponding rules relation. The rules relation will contain both zoning and building rules for the municipality. Each location will also belong to a zone to allow us to pull up zoning rules.

* from original schema
