The state entity and attributes are taken directly from the
SOAP relational schema. We created the person, politician,
expert, sand affiliation to be added to the database. Person
replaces congressperson and is subdivided into legislator
and expert. Every type of person can belong to a affiliation,
so that relation is applied to person. Every politician
represents a state, so that is applied to politician. Person
takes on all relations that Politician is involved with, as
reflected on the relational schema.

* from original schema
